

ARGUS CCTV evidence verification

Offline research pipeline with human review

Munis Aparji V S / Mithin Sagar S / Janit B / Guide Dr Premanand V

Problem and approach

A generated description can claim objects or intent that the video evidence does not support. ARGUS keeps the claim, its evidence references and the verification decision in an auditable ledger. It downgrades uncheckable semantics and computes severity only from supported observations.

Seven module pipeline

Feature cache to Temporal detector to Object and track evidence to Structured language to Independent critic to Thirteen severity factors to Validated policy to Human review

The visible rejection

Authored claim: A person is holding a knife. The synthetic evidence contains people and a bag, with no supporting knife detection. The critic marks the claim REJECTED. This means missing support, not proof of absence.

Executed sample checks

8 synthetic scenes / 15 authored claims / 2 unsupported claims rejected / 0 normal-run vocabulary violations / 4 of 4 injected invalid actions stripped.

Research status

Real UCF AUC, XD AP, human severity agreement, independent annotation agreement and Qwen ablations are PENDING. Reference severity weights are uncalibrated. No target or illustration is presented as an experimental result.

Boundaries

Offline clips only. No face recognition or identity inference. No cross-camera re-identification. No dispatch or external messaging. The system recommends and a human acts.
